EnviroCollective

Activity 1

- **<u>Summarized project background & business need and opportunity:</u>**

  We are working on rebuilding the website- EnviroCollective from scratch. The customer had brought us some concerns and needs for their website which we are going to empathize with and work upon. Our strategy is to create empathy maps and see what the customer Says, Thinks, Does, and Feels about their website's state and needs. Once we get an overview of the empathy map we will construct affinity diagrams and cluster common needs. Then our next step will be to create site maps and lay a skeleton of our subtasks. As our site maps are ready, we will create low fidelity prototypes of the website and work on improving them. Our next step will be to meet the customer and present our work done so far and get a review on the job. We will take comments and notable suggestions to the next part of our work.

  Our customer wants their website to be more graphical- showcasing more colours, interactive and appealing web design. They also want a better booking system which does not create conflicts in booking an appointment multiple times. The current booking system books a technician multiple appointments for multiple jobs he does at the same time since it doesn't block booking after being booked once. They also want all their works on one website and the newsletter to be highlighted on the home page. The user navigation should be easy-to-use and accessible.

- **Northstar & carryover customers**

  EnviroCollective serves as Regina's community hub for practical climate action by targeting core Northstar users, like active local environmentalists and volunteers along with ecosystem beneficiaries like carryover customers- individuals or groups that are not the primary, hard-core climate activists but are part of the Regina community benefits.

- **Project assumptions:**

  We are going to use softwares such as Figma, WordPress- to design the website pages. Google Docs and Word- to make notes and summarise our work. StoriesOnBoard- to create Site Maps, Github- to showcast our project in full and keep track of it.

- **Project constraints:**

  1) Time- We are constrained on time since we all have multiple classes and have to manage to take some time to meet together to work on the project.
  2) Skills- We are learning various software tools and finding our way out to work with them but we are not a pro yet.
  3) Experience- This is most of our first project working directly with customers so we didn't experience it before. Especially handling and defending our pov, adding their requirements to our work, meeting their deadlines and presenting in person.
